

Hemanth C

6363332160 | hemanthvenki123@gmail.com | [hemanth910/](#)

TECHNICAL SKILLS:

Languages: Java, Go, Scala, SQL, C++

Frameworks: Spark, SpringBoot, Dropwizard, Flask, Guice

Developer Tools and Tech: Amazon Web Services (EMR, Apache Airflow, S3, Stepfunctions, Apache Hudi, Dynamo DB, AWS Event bridge, SQS, SNS, EC2, AWS Lambda) and Oracle Cloud Infra (Compute, Object Storage, Load balances, Networking, Observability, Swagger, Postman, Kafka, Redis, Opensearch)

Deployment tools and Observability: AWS CDK, Terraform, Grafana

EXPERIENCE:

Oracle Cloud Infrastructure

Senior Member of Technical Staff

08/2025 – Present

- Modernized Oracle Cloud subscription provisioning platform by designing and implementing **Service Manager Proxy (SMP)** - a microservice system that replaced the legacy system, decoupling subscription management from billing, account, identity and customer data systems. Scaling and Handling the system for more than **1K TPS**. Created APIs for both synchronous and asynchronous processing of requests.
- Designed and developed more than **10+ RESTful APIs** using Dropwizard based framework (Java) and WFAAS workflows for order subscription, billing, provisionings, updates, suspension, resumption, and termination operations for Oracle cloud Saas and Iaas customers.
- Worked on successfully deprecating Admin partner portal (central for offer, partner management for Oracle sales), migrating over to latest frameworks leveraging latest cloud infra technologies for better end customer experience resulting in **80%** decrease in response times.

Amazon Development Center India

Software development Engineer 2

10/2023 – 07/2025

- Designed and developed an end-to-end system to facilitate computation of logistics expenses from vendors to Amazon Warehouses, accounting **\$3.6 Billion Annually**.
- Enhanced profitability and accounting accuracy for expenses with no designated account using Heuristic methodologies, **improving accuracy by 20% and automated \$60 Million MoM**. Built using EMR, Apache Spark, Apache Hudi, AWS Step function, AWS Eventbridge and Cloudwatch

Software development Engineer

10/2021 – 10/2023

- Designed and Developed a **configuration management system** to help orchestrate, maintain business critical configurations. Built using AWS pipelines, AWS AppConfig, Pydantic, AWS Lambda. Reducing deployment time from 2 hrs to 5 mins and currently hosts more than 200 configs.
- Developed a **Ingestion and Validation framework** to help ingest, validate, categorize and transform data from different data-sources, helping in automation of allocation capabilities. Successfully helping 10 programs onboard to the new architecture and **automate \$500 Million yearly**.
- Developed a **clustering algorithm** that leverages heuristic methods to allocate unaccounted costs. The algorithm employed a weighted network constructed over a configurable trailing period, enabling trend based dynamic cost allocation. Helping allocate **~\$1 Billion annually**.
- Implemented a comprehensive suite of automation scripts and SOPs, **reducing the average number of recurring tickets by 37%**. Automated using Python, AWS Lambda, AWS Eventbridge, Boto 3.

PROJECTS:

RideShare Application | AWS, Python, Flask, SQLite, Docker, Zookeeper and RabbitMQ

- Built an backend application to mimic popular cab sharing services, with high availability and fault tolerance
- Built using Flask REST APIs, on a leader-follower architecture and load balanced, rerouted reads to follower nodes
- Used SQLite for handling in-memory database requirements, Completely hosted on AWS

Visualization of Graph algorithms | Python, JavaScript, Flask, Sigma JS

- Developed a website to help visualize different graph algorithms like BFS, DFS, Dijkstra's etc
- Backend deployed on local through Flask and front end using javascript and Sigma JS library

EDUCATION:

PES University - Distinction with Honors

Bachelor of Technology in Computer Science

Bangalore, Karnataka

08/2017 – 05/2021
